Case Senior Scientist
• Jonathan Ozik, Argonne National Laboratory

Public Health Sciences (PHS) is the home in the Biological Sciences Division to biostatistics, epidemiology and health services research. These core fields in public health research share a focus on the development and implementation of complex analytic methods to understand the determinants of health, the efficacy of experimental treatments, and the structure of health care at the population level. Bringing together these fields in one department underscores their commonality and enhances opportunities for interdisciplinary research. Faculty members lead local, national, and international studies, and also welcome opportunities to collaborate with faculty across the Biological Sciences Division and the university. Substantively, our research themes include social and environmental determinants of health, genetics and disease, the economics of health care, and the
evaluation and implementation of new technologies in public health and clinical care. In terms of methodological expertise, areas in which our faculty has developed innovative approaches include: risk factor measurement; multilevel, clustered and longitudinal data; clinical trials; administrative health data; social networks; and statistical methods to assess the genetic and molecular basis of disease.

PROGRAM OF STUDY

Currently, the Department of Public Health Sciences offers the Master of Science in Public Health Sciences for Clinical Professionals, the Master of Public Health (MPH)/(MD-MPH), and a Ph.D. program. Current information on graduate programs is available from the department's website at http://health.uchicago.edu/.

The Degree of Doctor of Philosophy

The Department of Public Health Sciences at the University of Chicago offers a program of study leading to the Ph.D. with emphasis in biostatistics, epidemiology or health services research. This program will prepare individuals for research careers in population-based research in human health and biomedical science. The program is organized around a common quantitative core curriculum designed to prepare students methodologically for more in-depth study in their chosen field and for dissertation research. Beyond the core curriculum, each student will choose a major disciplinary area of concentration, take a sequence of advanced courses in that area, and prepare a dissertation of independent, original, and rigorous research. Opportunities for such concentrated study will be available in the three broad areas of biostatistics, epidemiology and health services research, areas of expertise represented by department faculty.

In addition to the concentration, each student will choose a minor program of study in another area either represented by department faculty or offered elsewhere in the Biological Sciences Division or on campus. Tailored to each individual student, the minor will vary in its degree of specificity from student to student. It may be in one of the broad areas represented by the department, or in a more specialized area. Examples of specialized minors include psychiatric or cancer epidemiology, health economics, economics of aging, clinical trials design, cancer biology, genetic or molecular epidemiology, bioinformatics, or medical decision theory.

Program Requirements

Students should expect to complete the program in 5 years by fulfilling the following requirements:

Complete 18 graduate level courses, including:

• A core curriculum of up to six courses.
• A major concentration program approved by the faculty consisting of at least 7 additional courses in a disciplinary domain (such as biostatistics).
• A minor program approved by the faculty consisting of at least 3 additional courses in a second disciplinary area.

Successfully complete a course in scientific integrity and the ethical conduct of research, usually in the first year of study (divisional ethics requirement).

Pass a multi-part preliminary examination demonstrating mastery of the core curriculum and of foundational knowledge in the chosen area of concentration.

Teach two quarters for credit in pre-approved teaching assistant positions in the biological sciences (divisional teaching requirement).

Establish a doctoral dissertation committee, present proposed dissertation research to members of that committee and other interested faculty, and obtain written approval from the committee on the proposed dissertation research.

Prepare and defend a doctoral dissertation of independent, original, and rigorous research in the chosen area of concentration.

Participate in the departmental seminar, in weekly faculty/student workshops, and in research workshops that overlap with the chosen area of concentration.

APPLICATION FOR ADMISSION

Applications for the PhD program should be received by December 1st for matriculation in Autumn Quarter and should consist of a BSD application (including three letters of recommendation), uploaded official transcript(s) from all degree institutions, GRE scores (optional), TOEFL scores (if applicable), CV/detailed relevant work history, a personal statement, and a research statement indicating area of major concentration.

Interested students should visit the department website at https://pbhs.uchicago.edu.

Masters of Public Health (MPH)

The Department of Public Health Sciences at the University of Chicago offers a program of study leading to the degree of Master of Public Health. This program will prepare individuals for careers as public health professionals or researchers. The program follows a competency-based curriculum that provides proficiency in several public health disciplines, including biostatistics, epidemiology, health policy and management, social and behavioral sciences, and environmental health sciences. Beyond the core curriculum, each student will choose an area of concentration and complete a sequence of advanced courses in that area. Areas of concentration include epidemiology and global health, health policy, and data science.

All students will complete a practicum experience, gaining hands-on training in public health research or applied public health practice, depending on the individual student's career goals. The practicum may be completed with internal partners at the University of Medical Center, or with external partners in a range of public health settings. Students will work with program staff and faculty to identify an appropriate host site. The practicum experience is expected to include an average of 80-100 hours of hands-on public health or research experience.

Program Requirements

The full-time program can be completed in as few as 5 academic quarters (4 full-time quarters and the summer practicum experience). Part-time options are also available. The following requirements must be fulfilled:

- Complete 13 graduate level courses, including:
  - A core curriculum of nine courses, including a practicum and a capstone course
  - A concentration consisting of four additional courses in the chosen field

The capstone project will include both a final paper and presentation. The culminating project may be research-based or applied, depending on the student's interests and career objectives. Students will work with a faculty mentor who will provide guidance and feedback throughout the capstone experience.

Students are also encouraged to participate in departmental seminars, in weekly faculty/student works, and in research workshops that are of interest.

APPLICATION FOR ADMISSION

The MPH program recognizes application deadlines of December 1 and March 1 for matriculation in Autumn Quarter. Late applications may be accepted after March 1 as space permits. The application consists of an online application, copies of transcripts from all postsecondary education, TOEFL or IELTS scores (if applicable), three letters of recommendation, resume or curriculum vitae, and a personal statement.

Interested students should visit the program website at https://publichealth.bsd.uchicago.edu/.

Doctor of Medicine - Master of Public Health (MD-MPH)

The Department of Public Health Sciences at the University of Chicago offers a program of study in partnership with the Pritzker School of Medicine that leads to the joint degree of Doctor of Medicine-Master of Public Health (MD-MPH). The program is designed for medical students with an interest in public health.
Graduates of the program will be trained as physicians prepared for research and leadership positions in a variety of healthcare settings.

The MD-MPH is a five-year program requiring 1100 units of MPH coursework in addition to the MD curriculum at the Pritzker School of Medicine. Students first complete three years of coursework at the medical school. Medical students interested in pursuing the joint degree are encouraged to apply to the MPH program during the Autumn Quarter of their third year of medical school. Students accepted into the MPH program will leave the medical school following their third year to pursue full-time MPH coursework for one year. In the final year, students finish their fourth year of medical school requirements and the MPH capstone project.

Program Requirements

Students must complete all requirements of the MD curriculum set forth by the Pritzker School of Medicine, as outlined here: [Link](http://graduateannouncements.uchicago.edu/graduate/thepritzkerschoolofmedicine/).

The program requires completion of 11 graduate level courses beyond the MD curriculum to count towards the MPH, including:

- A core curriculum of seven courses*
- A concentration consisting of four additional courses in the chosen field

*Two courses from the MD curriculum, The American Healthcare System and Health Care Disparities in America: Equity and Advocacy, count towards both the MD and MPH requirements, reducing the number of additional core courses in the MPH curriculum.

The capstone project will include both a final paper and presentation. The culminating project may be research-based or applied, depending on the student's interests and career objectives. Students will work with a faculty mentor who will provide guidance and feedback throughout the capstone experience.

Students are also encouraged to participate in departmental seminars, in weekly faculty/student workshops, and in research workshops that are of interest.

Application for Admission

Applications for the MD-MPH program are due by January 15 for matriculation in Autumn Quarter. Interested students are encouraged to apply during the autumn quarter of their third year at Pritzker. Students should first speak with the Pritzker Dean of Students and obtain a signed Letter of Good Standing to accompany their application. In addition to this letter, the application includes an online application, transcript from the Pritzker School of Medicine, one letter of recommendation from a current Pritzker faculty member, resume or curriculum vitae, and a personal statement.

Interested students should visit the program website at [Link](https://publichealth.bsd.uchicago.edu/).

Master of Science in Public Health Sciences for Clinical Professionals

The Master of Science Program for Clinical Professionals is a course of study in the theory, methods, and concepts of biostatistics, epidemiology, and health services research needed to design and carry out clinical and epidemiologic research programs. It is designed for the professional enhancement of physicians and other clinical professionals. The program can be completed in one year of full time study, or it can be undertaken in conjunction with a clinical fellowship or training program, in which case the course work may be distributed over two or three years. Students in the program acquire skills with basic statistical methods, followed by additional training in the fundamental theory and methods of epidemiology, biostatistics, and health services research. Through choice from a broad range of elective courses, students can specialize in one of the three disciplinary areas.

Entrance Requirements

Applicants should either have a doctoral level clinical degree (such as M.D., D.O., or nursing Ph.D.) from an accredited institution, or must have completed pre-clinical training at an accredited medical school. In the latter...
case, the candidate must provide a plan for completion of both the M.D. and S.M. degrees, and a letter of support from the candidate’s medical school.

**PROGRAM REQUIREMENTS**

A candidate in this program for the degree of Master of Science in Public Health Sciences must complete the required and elective courses (nine courses in total), and complete a master’s paper.

**APPLICATION FOR ADMISSION**

Applications for the Master of Science in Public Health Sciences for Clinical Professionals program should be completed by March 15 for matriculation in Autumn Quarter.

If the degree program will be pursued while the candidate will be participating in a clinical training program, a letter of support from the training program director is required. Candidates must also submit a statement describing how the proposed course of study will enhance their professional objectives. In addition, candidates must provide transcripts from all post secondary institutions, MCAT or GRE scores, and a completed Biological Sciences Division application.

Interested students should visit the department website at http://health.uchicago.edu (http://health.bsd.uchicago.edu).

**PUBLIC HEALTH SCIENCES COURSES**

**PBHS 30910. Epidemiology and Population Health. 100 Units.**

Epidemiology is the basic science of public health. It is the study of how diseases are distributed across populations and how one designs population-based studies to learn about disease causes, with the object of identifying preventive strategies. Epidemiology is a quantitative field and draws on biostatistical methods. Historically, epidemiology’s roots were in the investigation of infectious disease outbreaks and epidemics. Since the mid-twentieth century, the scope of epidemiologic investigations has expanded to a fuller range non-infectious diseases and health problems. This course will introduce classic studies, study designs and analytic methods, with a focus on global health problems.

Equivalent Course(s): HLTH 20910, PPHA 36410, ENST 27400, STAT 22810

**PBHS 31001. Epidemiologic Methods. 100 Units.**

This course provides students with an in-depth understanding of epidemiologic concepts and methods. It is the second course in the epidemiology series. The focus of this course will be in practical and theoretical considerations of observational research methods; statistical methods and applications in epidemiologic studies; in-depth evaluation of bias, confounding, and interaction; and communicating epidemiologic findings. Students will also learn how to perform data analysis using classic methods.

Equivalent Course(s): STAT 35700

**PBHS 31100. Introduction to Mathematical Modeling in Public Health. 100 Units.**

Modeling is a simplified representation of reality that aims to capture essential features of a real-life object or process. Mathematical modeling in public health encompasses a wide array of methodologies offering a powerful toolkit to approach questions that would otherwise be extremely difficult or impossible to answer. This course will introduce students to the conceptual framework of mechanistic modeling and cover the basics of the most widely used mathematical modeling approaches in public health. The course will combine lectures and interactive computer sessions to help students develop practical skills of using basic quantitative techniques.
PBHS 31200. Cancer Epidemiology. 100 Units.
The purpose of this course is to review the basic concepts and issues relevant to cancer epidemiology. Specifically, this course will focus on interpreting cancer statistics, and describing the current state of knowledge regarding the etiology and risk factors for the major cancer sites. In addition, issues in research design and interpretation within the context of cancer epidemiology, as well as the molecular and cellular basis of carcinogenesis as it pertains to cancer occurrence in populations will be discussed. The course is appropriate for students who have an introductory knowledge of epidemiology. Previous study of cancer biology is helpful but not required.

PBHS 31300. Introduction to Infectious Disease Epidemiology. 100 Units.
This intermediate-level course will build off basic epidemiology foundations to understand principles of infectious disease epidemiology as well as focus on specific diseases & their public health significance. We will examine disease transmission and the interactions between pathogens, hosts, and environment. This course introduces key pathogens, diagnostics, and immune responses. In addition, we will explore the roles of climate change, globalization, and social determinants of health on infectious diseases. Students will learn about research and public health responses to infectious diseases, including study design, modeling, molecular epidemiology, surveillance, outbreak investigation, and prevention.
Equivalent Course(s): MEDC 31300, BIOS 25419

PBHS 31414. Gender, Health & Medicine. 100 Units.
From the day we are born til the day we die, we experience a gendered world that shapes our opportunities, our social interactions, and even our physical health and wellbeing. This course will provide an introduction to sociological perspectives on gender, physical and mental health, and medicine while also providing a deep interrogation of the social, institutional, and biological links between gender and health. We will discuss inequalities in morbidity, mortality, and health behaviors of women, men, and transgendered individuals from different race, ethnic, and class backgrounds, and we will use sociological concepts, theories, and methods to understand why these differences appear. Finally, we will examine how medicine as an institution and medical practices as organizations sometimes contribute to and combat gender inequality in health. By the end of the course, you will be familiar with social scientific perspectives on (1) gender, (2) mental and physical health, and (3) the practice of medicine, as well as some of the fundamental debates in current medical sociology and sociology of gender.
Equivalent Course(s): CHDV 44214, CRES 44214, SOCI 40221, GNSE 44214

PBHS 31450. Social Inequalities in Health: Race/Ethnicity & Class. 100 Units.
This course examines how social stratification and social inequality shape racial/ethnic and socioeconomic inequalities in health. In particular, we will explore the production of race and class inequality in the US and draw on the extant theoretical and empirical literature to understand how these social factors influence health behaviors and health outcomes. Finally, we will review both the classic and emerging methodological approaches used by public health and social scientists to measure and test how these features of society get “under the skin” to shape a variety of health outcomes.
Equivalent Course(s): HLTH 27450, CRES 27450

PBHS 31510. Critical Readings in Epidemiology. 100 Units.
Course consists of reading and critiquing important and innovative recent papers in epidemiology. Each week, there will be a different substantive or disease focus for the papers. Research areas covered will be primarily, but not exclusively, in noninfectious diseases. Different faculty will lead the discussion each week and students will prepare and present summary critiques of the articles.

PBHS 31710. Environmental Health. 100 Units.
This course provides an introduction to topics and methods in environmental epidemiology. Topical areas include selected air and water pollutants, radiation, pesticides, metals, environmental microbial exposures, persistent organic pollutants, endocrine-disrupting chemicals, disease clusters, disaster epidemiology, environmental justice, and climate change. Exposure assessment and statistical methods for evaluation of environmental and occupational factors will be considered in the context of specific applications.
Equivalent Course(s): PBHS 22710

PBHS 31831. Genetic & Molecular Epidemiology. 100 Units.
This course is designed for students with strong research interests related to identifying and characterizing the role of genetic and molecular features in human disease. Students will be introduced to the key concepts and methodological issues encountered in epidemiological studies that utilize genetic and molecular data. This course will train students on the theoretical and practical aspects of study design and data generation, and also provide the relevant hands-on training for quality control, management, and analysis of large-scale genomic/molecular data. Students are expected to have taken prior coursework in epidemiology, biostatistics, and genetics.

PBHS 31900. Global Health Metrics. 100 Units.
This course provides an overview of the causes of illness and injury in populations across the world and the most important risk factors. We will discuss how population health is measured using summary indicators that combine mortality and non-fatal health outcomes. We will use these indicators to compare and contrast the health of populations across global regions and in time. Sound measurement of the global burden of disease is
This course will provide an introduction to the basic concepts of statistics as applied to the bio-medical and public health sciences. Emphasis is on the use and interpretation of statistical tools for data analysis. Topics include (i) descriptive statistics; (ii) probability and sampling; (iii) the methods of statistical inference; and (iv) an introduction to linear and logistics regression.

PBHS 32400. Applied Regression Analysis. 100 Units.
This course introduces the methods and applications of fitting and interpreting multiple regression models. The primary emphasis is on the method of least squares and its many varieties. Topics include the examination of residuals, the transformation of data, strategies and criteria for the selection of a regression equation, the use of dummy variables, tests of fit, nonlinear models, biases due to excluded variables and measurement error, and the use and interpretation of computer package regression programs. The techniques discussed are illustrated by many real examples involving data from both the natural and social sciences. Matrix notation is introduced as needed. Prerequisite: PBHS 32100. Equivalent Course(s): PBHS 32400
Equivalent Course(s): STAT 22400

PBHS 32410. Regression Analysis for Health and Social Research. 100 Units.
This course is an introduction to the methods and applications of fitting and interpreting multiple regression models. The main emphasis is on the method of least squares. Topics include the examination of residuals, the transformation of data, strategies and criteria for the selection of a regression equation, the use of dummy variables, tests of fit. Stata computer package will be used extensively, but previous familiarity with Stata is not assumed. The techniques discussed will be illustrated by real examples involving health and social science data. Equivalent Course(s): STAT 22401

PBHS 32600. Analysis of Categorical Data. 100 Units.
This course covers statistical methods for the analysis of qualitative and counted data. Topics include description and inference for binomial and multinomial data using proportions and odds ratios; multi-way contingency tables; generalized linear models for discrete data; logistic regression for binary responses; multi-category logit models for nominal and ordinal responses; loglinear models for counted data; and inference for matched-pairs and correlated data. Applications and interpretations of statistical models are emphasized. Equivalent Course(s): STAT 22600

PBHS 32700. Biostatistical Methods. 100 Units.
This course is designed to provide students with tools for analyzing categorical, count, and time-to-event data frequently encountered in medicine, public health, and related biological and social sciences. This course emphasizes application of the methodology rather than statistical theory (e.g., recognition of the appropriate methods; interpretation and presentation of results). Methods covered include contingency table analysis, Kaplan-Meier survival analysis, Cox proportional-hazards survival analysis, logistic regression, and Poisson regression. Equivalent Course(s): STAT 22700

PBHS 32901. Introduction to Clinical Trials. 100 Units.
This course will review major components of clinical trial conduct, including the formulation of clinical hypotheses and study endpoints, trial design, development of the research protocol, trial progress monitoring, analysis, and the summary and reporting of results. Other aspects of clinical trials to be discussed include ethical and regulatory issues in human subjects research, data quality control, meta-analytic overviews and consensus in treatment strategy resulting from clinical trials, and the broader impact of clinical trials on public health. Equivalent Course(s): STAT 35201

PBHS 3300. Applied Longitudinal Data Analysis. 100 Units.
Longitudinal data consist of multiple measures over time on a sample of individuals. This type of data occurs extensively in both observational and experimental biomedical and public health studies, as well as in studies in sociology and applied economics. This course will provide an introduction to the principles and methods for the analysis of longitudinal data. Whereas some supporting statistical theory will be given, emphasis will be on data analysis and interpretation of models for longitudinal data. Problems will be motivated by applications in epidemiology, clinical medicine, health services research, and disease natural history studies. Equivalent Course(s): STAT 36900, CHDV 32501

PBHS 33400. Multilevel Modeling. 100 Units.
This course will focus on the analysis of multilevel data in which subjects are nested within clusters (e.g., health care providers, hospitals). The focus will be on clustered data, and several extensions to the basic two-level multilevel model will be considered including three-level, cross-classified, multiple membership, and multivariate models. In addition to models for continuous outcomes, methods for non-normal outcomes will be covered, including multilevel models for dichotomous, ordinal, nominal, time-to-event, and count outcomes. Some statistical theory will be given, but the focus will be on application and interpretation of the statistical analyses.
Equivalent Course(s): CHDV 32401

PBHS 33500. Statistical Applications. 100 Units.
This course provides a transition between statistical theory and practice. The course will cover statistical applications in medicine, mental health, environmental science, analytical chemistry, and public policy. Lectures are oriented around specific examples from a variety of content areas. Opportunities for the class to work on interesting applied problems presented by U of C faculty will be provided. Although an overview of relevant statistical theory will be presented, emphasis is on the development of statistical solutions to interesting applied problems.
Equivalent Course(s): STAT 35800, CHDV 32702

PBHS 33700. Sexual Health: Identity, Behavior, and Outcomes. 100 Units.
Sexual health is a growing component of public health outreach. The goal of this course is to provide students with a foundational understanding of sexual health from a public health perspective. Through participation in this course, students will increase their knowledge about the history of sexual health promotion in the public health sphere. They will delve into sexual and gender identity construction and explore identity-behavioral expressions. They will critically examine and discuss common sexual health issues addressed by public health practitioners, their epidemiology, and their underlying social determinants; a global health lens will be applied to such examinations. Additionally, recognition of the key methodological considerations in the measurement of sexual behavior and sexual health outcomes will be elucidated (including strengths and limitations of various methodological approaches -quantitative, qualitative, clinical, and biomedical). By the completion of the course, students should be able to demonstrate knowledge and application of key theoretical foundations of sexual health promotion and sexual health behavior change and be able to promote sexual health messages through marketing and dissemination. From a policy perspective, student can expect an increased knowledge about issues related to social and legislative policy analyses, their applications, and implications.
Equivalent Course(s): HLTH 23700, GNSE 33702, PBHS 23700, GNSE 23702

PBHS 34100. Foundations of Public Health. 100 Units.
This course provides an overview and introduction to the role, theories, and methods of health promotion and health behavioral science in addressing the public health needs of the 21st Century. The course will cover a wide range of topics including: the history of public health, the basic institutional and organizational structures created to monitor public health; socio-cultural factors in disease etiology and the role of social conditions and social policy in addressing critical public health problems; individual, group, and community strategies for health behavior change; and current issues (e.g., eHealth) in behavioral science for health promotion. The course provides students with the opportunity to critically analyze current literature and gain an understanding of health promotion, its evolution, underlying theories, applications, and effectiveness in promoting health and preventing illness.

PBHS 34200. Health Communication & Health Behavior Theory. 100 Units.
This course addresses the psychological, social, and environmental determinants of a wide range of health and health-related behavior. Theoretical models from the behavioral and social sciences will be used to explain health behavior at the individual, interpersonal, and community levels. The course emphasizes the acquisition of theoretical understandings, but also is intended to improve actions or activities undertaken for the purpose of promoting, preserving, or restoring wellness. Towards that end, students in this course will learn how to use peer-reviewed research and key social marketing principles to develop a comprehensive and effective social marketing campaign; learn how to target health communication efforts towards specific audiences and via varied channels of distribution; understand the role of social media and technology in facilitating/influencing behavior changes; study current examples of successful social marketing initiatives; and discuss the ethics surrounding health communication and social marketing efforts.

PBHS 34300. Public Health Programs: Planning, Implementation & Evaluation. 100 Units.
The course is designed to provide students with an overview of how to develop public health programs and interventions. Students will learn the best ways to help solve the critical health issues affecting our communities at local, national, and international levels. Students will learn the start-to-finish processes of public health programming including understanding the problem using existent data, needs assessments/surveillance, using goals/objectives, basic design, message construction, planning, implementation, and creating an evaluation system that links back to goals/objectives. The course will also include an overview of effective evidence-based public health interventions that span multiple health domains and delivery modalities. Students will have the opportunity to create their own health programs through the quarter.

PBHS 34400. Computer Programming for Public Health. 100 Units.
This course will provide an introductory and intermediate level overview of computer science and programming skills. Students will learn concepts in computer programming and how programming language works, as well as theories behind information system design and management. Specific topics include: Python and R programming language, data structures and management, algorithm design, data visualizations, and basic project management for reproducible research.
Equivalent Course(s): MSPH 33000
PBHS 34500. Machine Learning for Public Health. 100 Units.
This course provides an introduction to machine learning in the context of public health and medical applications. Key concepts in the design and evaluation of machine learning algorithms will be presented. A variety of algorithms will be covered (e.g., random forests, splines, boosting, neural networks, and ensembles) and include hands-on experience with programming in R.

PBHS 34600. Mixed Method Research in Community Settings. 100 Units.
This course is designed to train students in mixed methods research design and evaluation. Mixed methods are the use of quantitative AND qualitative methods to explore health problems, engage communities, and evaluate solutions. It includes an in-depth discussion of the rationales for specific techniques and the role of theory in guiding and informing a health research project. Students will learn design considerations that are best suited for qualitative over quantitative methods (and vice versa) or both methods. Specifically, the course focuses on training, through lecture, group work and hands-on experiences, across five data collection methods commonly used in mixed methods research: survey design and implementation, observation, interview, focus group, and use of existing quantitative data. Students will undertake a pilot research study as a means of practicing their mixed methods approaches and data collection skills. Multiple data analyses techniques (e.g., content analysis, narrative analysis, multivariable model construction, qual-quant triangulation) will be conceptually explained. Students will leave the course with practical skills to conduct research through public health practice.
Equivalent Course(s): PBHS 24600

PBHS 34700. Community Health Promotion. 100 Units.
A person’s health depends not only their genes or behavior, but also where they live, learn, work, play, and age. This course examines how social and community structures and policies influence health and can produce health disparities. Structural issues (e.g., economic stability, housing, food security, health care access and quality, broadband access, health and digital literacy, violence, discrimination) are key social determinants of health. This course will describe and apply: 1) frameworks for understanding health determinants acting at multiple levels, and 2) community and structural intervention approaches to promote health. Students will learn how to prioritize among health determinants and select among intervention approaches to solve public health problems and improve public health practice.
Equivalent Course(s): PBHS 24700

PBHS 35100. Health Services Research Methods. 100 Units.
The purpose of this course is to better acquaint students with the methodological issues of research design and data analysis widely used in empirical health services research. To deal with these methods, the course will use a combination of readings, lectures, problem sets (using STATA), and discussion of applications. The course assumes that students have had a prior course in statistics, including the use of linear regression methods.
Equivalent Course(s): PPHA 38010, SSAD 46300, HLTH 29100

PBHS 35301. Aging and Health Policy. 100 Units.
This course is a seminar in aging and health policy and the relationships between policy, financing, access to care, and quality of care for the elderly. The focus is on health care systems and policy as opposed to demography and biological aspects of aging. Specific topics include Medicaid and Medicare policy; long-term care insurance and financing; workforce issues; dementia and end-of-life care; the culture change movement; work and retirement as it relates to health policy; and cross-national comparisons of health policy toward the elderly. Students will engage in an ongoing discussion of policy options and learn to evaluate their potential to improve quality and ensure access for the elderly to health care and long-term care.
Equivalent Course(s): SSAD 49022, PPHA 42401

PBHS 35401. Topics in U.S. Health Economics, Sociology, and Policy. 100 Units.
This seminar course will explore three topics: 1) Do physicians, hospitals, and health plans have a business case for making investments to improve quality in health care? 2) What relationship (if any) is there among the malpractice system, medical errors, patient safety, and quality? 3) Has medical practice in the U.S. been corporatized? What might this mean, and what might be the benefits and costs? We will approach these topics by drawing from the health policy, law, and organizational and institutional sociology and economics literatures.
Equivalent Course(s): PPHA 35400, SOCI 50038

PBHS 35411. The U.S. Health Care System. 100 Units.
This course is a comprehensive examination of many of the key components of the U.S. health care system and how they work, intended for students from a wide range of backgrounds. Among others, topics may include public and private health insurance, the uninsured, health reform, hospitals, physicians, health care quality and costs, health information technology, pharmaceuticals, medical devices and diagnostics, long-term care, mental health services, and comparisons with health systems in developed and emerging markets. Students will leave the course with practical skills to conduct research through public health practice.
Equivalent Course(s): SSAD 47512, PPHA 37510

PBHS 35500. Introduction to U.S. Health Policy and Politics. 100 Units.
The purpose of this course is to introduce students to the concepts needed to critically evaluate U.S. health policy issues. The course will 1) provide an overview of the U.S. health system including its institutions, stakeholders, and financing mechanisms, 2) describe the politics of health and illuminate how the structure of our political system shapes health policy outcomes, and 3) offer a framework for assessing the critical features central to health policy debates. Building upon this knowledge, the course will conclude with a discussion of strategies
for influencing the health policy process and how they might be employed in future leadership roles within the health sector.
Equivalent Course(s): HLTH 25500, PPHA 37720, SSAD 45011, PBPL 25500

PBHS 35600. Money, Medicine, and Markets: The Financialization of the US Health System. 100 Units.
This class tracks the complex ways capital influences health and health care delivery in the United States, with extensions to other national contexts. Broadly, this course is designed to provide students with the tools to identify and examine the nature of capital in shaping the health of Americans and is divided into 3 Parts. In Part 1, we will review the macro changes in health care delivery in the US over the past century, with readings focusing on financialization and its application to health care privatization and consolidation. In Part 2, the course visits different topics of health care where tensions between profit maximization, health care quality, and health equity are most visible. These topics include nonprofit vs. for-profit actors, private-public partnerships, the pharmaceutical industry, private equity activity, the insurance industry, physician entrepreneurs, management consultants, and the women’s health industry. In Part 3, using concepts from political economy and epidemiology, we will grapple with embodiment and the link between capitalism and population health through financial lending, macroeconomic conditions, economic inequality, and the commercial determinants of health. This course will introduce students to cutting-edge scholarship across a range of fields, including health economics, public health, sociology, and political science.
Equivalent Course(s): HLTH 25600, SSAD 45601, PPHA 38340

PBHS 37900. Health Outcomes and the Quality of Medical Care. 100 Units.
This course will be an intensive introduction to the assessment and improvement of health outcomes and the quality of medical care. We will address two central questions: 1) How do you measure health outcomes and the quality of care? 2) How do you effect and evaluate change? Topics will include the outcomes movement and concepts of quality; scaling and scoring health status and quality of life measures and assessing validity and reliability of these measures; explicit and implicit quality measures; preventable morbidity; patient satisfaction; physician behavior; practice guidelines; physician profiling; and total quality management.
Equivalent Course(s): SSAD 49300, PPHA 37900

PBHS 38000. Health Status Assessment: Measurement and Inference. 100 Units.
This course will be an introduction to survey design and sampling methodology focused on health outcomes and the quality of medical care. We will address two central questions: 1) How do we measure health outcomes and the quality of medical care? 2) How do we insure that the study population is representative of the population of interest? Topics will include concepts of quality and health status assessment, scaling and scoring health status and quality of life measures, assessing validity and reliability of these measures, uses and limitations of outcomes data, sample design, sampling methodology, and survey implementation. Recommended: Multivariate statistics, epidemiology.
Equivalent Course(s): PPHA 38000

PBHS 38010. Economic Analysis of Health Policies. 100 Units.
This course covers the foundations of the economics of health care as applied to current issues of health care policy. Content includes demand for health, medical care, and insurance; supply of medical care and behavior of health care practitioners; and economic perspectives on measurement in health care research. Using a combination of lectures, readings, problem sets, and discussion of newspaper and journal articles, the goal is for students to acquire a basic understanding of economic knowledge and thinking and to be able to apply that knowledge in analyzing policies. The course is open to graduate students and a limited number of undergraduates. A prior course in microeconomics is recommended; for those students without this preparation, the beginning of the course will include a short primer on key concepts in microeconomics.
Equivalent Course(s): PPHA 38290, HLTH 28010

PBHS 38100. Economics of Health Care. 100 Units.
Theory and evidence on the economics of US medical care. Particular focus on the causes and consequences of high and rising health expenditures; technological change and the specific role of institutions in current reform efforts. The course is targeted to MA and PhD level students in business, policy and related disciplines. The course format will be a mix of lectures and presentations by guest speakers. Grading will be based on class participation, performance on course assignments and a final project. Attendance in all seminars is required.

PBHS 38400. Advanced Topics in Health Economics. 100 Units.
The purpose of this course is to provide substantial exposure to the state of the evidence and the major theoretical and empirical approaches used to study salient issues in health economics. Selected topics may vary from year to year; examples include health capital, health insurance, health behaviors, health care market structure and competition, not-for-profit ownership, payment incentives, and the effects of information on provider behavior (e.g., public reporting and value-based purchasing) and consumer behavior (e.g., advertising and medical decision making)

PBHS 39000. Master’s Readings: Public Health Sciences. 300.00 Units.
Arrange course content and meeting times with instructor.

PBHS 39100. Master’s Research: Public Health Sciences. 300.00 Units.
Arrange course content and meeting times with instructor.
PBHS 39200. Public Health in Practice. 100 Units.
This is a practicum experience that provides an opportunity for students to demonstrate mastery of core competencies and potential for future success as a public health professional or researcher.

PBHS 39210. PBHS MPH Reading/Research. 300.00 Units.
Independent research/study for MPH students. Details to be arranged and approved by instructor.

PBHS 39300. MPH Capstone Writing and Presentation. 100 Units.
The capstone is a culminating experience designed to provide students with the opportunity to demonstrate mastery of knowledge and skills they have acquired through their Masters in Public Health (MPH) education. Students will work with an advisor on real-time public health issues appropriately applying theory, methods and tools learned in the MPH program. There will also be dedicated class time to explore topics such as NIH grants and grant writing, publishing in peer-reviewed journals, community partnerships, and other areas germane to public health practice. Independent of MPH concentration, this course provides students with an opportunity to work on a research or practice-based project intended to address a public health problem. Students are expected to synthesize and apply what they have learned in their public health coursework as well as develop skills specifically needed for the capstone project and taught through the capstone course. Some portion of the capstone project may entail either development or evaluation of a health program/intervention designed to address a specific public health problem in a particular community, the development and implementation of a community health assessment or other primary data collection effort, or a secondary data/policy analysis to address a specific public health problem. A (1) final report and (2) presentation prepared by the student is the culminating product for the capstone.

PBHS 40000. Public Health Sciences PhD Research & Training. 300.00 Units.
Arrange course content and meeting times with instructor.

PBHS 40100. Advanced Topics in Ethics for Public Health Sciences. 50 Units.
Arrange course content and meeting times with instructor.

PBHS 40500. Advanced Epidemiologic Methods. 100 Units.
This course examines some features of study design, but is primarily focused on analytic issues encountered in epidemiologic research. The objective of this course is to enable students to conduct thoughtful analysis of epidemiologic and other population research data. Concepts and methods that will be covered include: matching, sampling, conditional logistic regression, survival analysis, ordinal and polytomous logistic regressions, multiple imputation, and screening and diagnostic test evaluation. The course follows in sequence the material presented in "Epidemiologic Methods."

PBHS 43010. Applied Bayesian Modeling and Inference. 100 Units.
Course begins with basic probability and distribution theory, and covers a wide range of topics related to Bayesian modeling, computation, and inference. Significant amount of effort will be directed to teaching students on how to build and apply hierarchical models and perform posterior inference. The first half of the course will be focused on basic theory, modeling, and computation using Markov chain Monte Carlo methods, and the second half of the course will be about advanced models and applications. Computation and application will be emphasized so that students will be able to solve real-world problems with Bayesian techniques. Equivalent Course(s): STAT 35920

PBHS 43201. Introduction to Causal Inference. 100 Units.
This course is designed for graduate students and advanced undergraduate students from the social sciences, education, public health science, public policy, social service administration, and statistics who are involved in quantitative research and are interested in studying causality. The goal of this course is to equip students with basic knowledge of and analytic skills in causal inference. Topics for the course will include the potential outcomes framework for causal inference; experimental and observational studies; identification assumptions for causal parameters; potential pitfalls of using ANCOVA to estimate a causal effect; propensity score based methods including matching, stratification, inverse-probability-of-treatment-weighting (IPTW), marginal mean weighting through stratification (MMWS), and doubly robust estimation; the instrumental variable (IV) method; regression discontinuity design (RDD) including sharp RDD and fuzzy RDD; difference in difference (DID) and generalized DID methods for cross-section and panel data, and fixed effects model. Intermediate Statistics or equivalent such as STAT 224/PBHS 324, PP 31301, BUS 41100, or SOC 30005 is a prerequisite. This course is a prerequisite for "Advanced Topics in Causal Inference" and "Mediation, moderation, and spillover effects." Equivalent Course(s): CHDV 20102, MACS 51000, SOCI 30315, STAT 31900, PLSC 30102, CHDV 30102

PBHS 45610. Policy Analysis: Meths/Apps. 100 Units.
This master's-level course provides students with the basic tools of policy analysis. Students will learn and apply tools of decision analysis in written group assignments and in an accompanying computer lab. Students will also learn and apply concepts of cost-effectiveness, cost-benefit, and cost-utility analysis with social service, medical, public health applications. Doctoral students and master's students who intend to take the course Advanced Applications of Cost-Effectiveness Analysis in Health will complete two additional laboratory assignments. Topics to be covered include: Decision trees for structured policy analysis, the economic value of information, analysis of screening programs for HIV and child maltreatment, sensitivity analysis, cost-effectiveness analysis of life-saving interventions and programs to reduce behavioral risk, valuing quality of life outcomes, ethical issues in cost-benefit analysis, analysis of irrational risk behaviors. Substantive areas covered include: HIV/substance abuse...
use prevention, school-based prevention of sexual risk, smoking cessation, and housing policy. In the associated learning lab, students will use computer decision software to build and analyze decision trees in policy-relevant examples. They will conduct one-way and two-way sensitivity analysis to explore the impact of key parameters on cost-effectiveness of alternative policies. Students will receive an introduction to dynamic modeling in the context of HIV prevention, cancer s
Equivalent Course(s): PPHA 40101, SSAD 45600
